

3.

In the Stanford GSB article, Professor Akbarpour explains that one of the inefficiencies is a lack of understanding that “every kidney market is in a continuous state of change, with would-be donors and recipients constantly dropping in and out.” A dynamic system means that kidney exchange managers should be more cognizant of how often they check to find matches. Frequency of checking in such dynamic markets no doubt has an effect on matches and efficiency of matching.

Another issue lies in the “repugnant market” moniker. As both articles explain, the market for kidneys is one quite often looked down upon. This makes a prominent exchange tougher to implement, and can cause issues in communication between those attempting to design the market. For example, Professor Roth explained that he often needs to lead with an abundantly clear message that he doesn’t want to buy or sell kidneys, because that’s what doctors think he is going to be talking about with them. The dangerousness of the illegal market for kidneys scares many away from thinking about a potential kidney exchange, and while exchanges are a growing idea, they still haven’t reached the most efficient level of prominence in part due to the repugnant-market moniker. Professor Akbarpour agrees that “stigma” is a lot of what’s preventing a more efficient and higher-supply exchange.
